

**Source B for Question 2**

H Limited manufactures toys. To produce a new product, the company needs to purchase a new machine (Machine A) costing \$180 000 from a local company. Machine A's estimated useful life is four years and it will have zero scrap value.

The new product's life is four years. The estimated revenue and costs are as follows:

Sales revenue		Costs
Unit selling price \$100		Direct materials – \$15 per unit Direct labour – \$24 per unit Fixed overhead (excluding depreciation) – \$90 000 per annum
Sales (in units)		
year	units	
1	2000	
2	3000	
3	4000	
4	1000	

H Limited's cost of capital is 10%.

Relevant discount factors are as follows:

Year	10%	16%
1	0.909	0.862
2	0.826	0.743
3	0.751	0.641
4	0.683	0.552

2(a)	<p><b>Explain how the internal rate of return (IRR) can be used to make a capital investment decision.</b></p> <p>Internal rate of return (IRR) considers the time value of money <b>(1)</b> which gives a rate of discount that yields a zero net present value / the present value of total cash inflows equal to the present value of total cash outflows. <b>(1)</b></p> <p>When capital investment has an IRR above the cost of capital rate, it will give a positive net present value <b>(1)</b> and the capital investment should be accepted. <b>(1)</b></p> <p>If there are two mutually exclusively capital investments and both give an IRR above the cost of capital rate, the capital investment with higher IRR will be chosen. <b>(1)</b></p> <p><b>Max 4</b> <b>Accept other valid responses.</b></p>	<b>4</b>
